

Functions:-

A function is a block of reusable code that performs a task.

Syntax :-

```
function functionName(){  
    // code that will execute when you call the function  
}
```

-- How to call a function/Invoking a function:-

To call a function we will simply write the function name with '()'

example :-

```
functionName();
```

Example of how to use a function to make our code reusable:-

```
// console.log("Hello Hemlata");  
// console.log("Welcome");  
// console.log("Hello Shubam");  
// console.log("Welcome");  
// console.log("Hello Sayali");  
// console.log("Welcome");
```

```
function greet(name){ // name is a parameter  
    console.log(`Hello ${name}`); // we used the value stored inside parameter  
    console.log("Welcome");  
};
```

`greet("Hemlata");` // "Hemlata" is an argument that we passed to the function while calling it.

```
greet("Shubham");  
greet("Sayali");
```
